

human subject and a structural means for controlling penetration of the needle to the desired depth within the intradermal space; and
delivering the therapeutic substance to the intradermal space.

REMARKS

New claim 67 is fully supported in the application as filed, see paragraphs [0037], [0038] and [0060], and does not introduce any new matter.

Respectfully submitted,

Date: November 4, 2002

MARKED VERSION SHOWING CHANGES MADE

67. (New) A method of delivery of a therapeutic substance into a human subject, comprising:

targeting the intradermal space of the human subject with a dermal access means, which includes a needle that is inserted substantially perpendicular to the skin of the human subject and a structural means for controlling penetration of the needle to the desired depth within the intradermal space; and

delivering the therapeutic substance to the intradermal space.
